
ABSTRACT

Ad
Uncompleted voice calls towards a mobile entity [(20)] are transferred to a service system [(40)] where they are recorded and inserted in corresponding data messages (55). These messages that are temporarily held in the service system and later transferred to the mobile entity (20) using via a data-capable bearer service [(17)] of a mobile radio infrastructure. (10). This The transfer is effected at a time determined with a view to reducing the peak traffic loading non-peak traffic loading time of the mobile radio infrastructure (10). At the, without a call being made from the mobile unit. The mobile entity [(20)] stores the data messages are stored for subsequent access by a user.
